ENERGY

The Creative Lighting utilises a Go Between Optics (GoBo) which is a stencil or template that alters the shape of emitted light. This allows clients to project a defined light graphical display on to a hard surface. GoBos are increasingly being used in the public space to serve a creative purpose as an alternative, or complement, to banners and signage.

The SMART.NODE™ can accommodate moveable fixtures for year-round outdoor use to suit a range of creative and communicative lighting purposes in the public space. GoBo motifs can be changed without the need for tools.
