Smart Waste

ENVIRONMENT

Smart Waste monitoring revolutionises the method in which Land Authorities manage waste collection in public areas. Upon installation of the appropriate module, the SMART.NODE™ acts as a receiving point for smart waste hardware installed in nearby smart bins. Key benefits include the reduced risk and improved efficiency through the reduction of collections, reduction in operational expenditure and reduction in total life costs.

The internal bin sensor communicates via the LoRaWAN Gateway and e3 platform and allows for the remote collection of data from the bin sensor through the use of ultrasonic and optical laser. This data is received at changeable interval over a 24-hour period.
