## Bird Deterrent

POLE ACCESSORIES

The Bird Deterrent for lighting is a support covered with spikes, which is mounted on top of the floodlight to prevent birds landing. This is for two reasons.

Firstly, the warm environment of the lighting placed up high is not unlike a treetop which could encourage large birds to nest on the light, causing a fire risk to both the birds and the nest as well as the lights.

Secondly, their excrement could damage the paint and in the case of coastal environments, create corrosion. This accessory is a must when placing lights in coastal environments.
